1 Central Claims

- Svolik’s organizing move is to reframe authoritarian politics around **two distinct, analytically separable problems** that every dictator must solve simultaneously: the **problem of authoritarian control** (how the regime manages the relationship between rulers and the masses/opposition—preventing successful rebellion) and the **problem of power-sharing** (how the dictator manages the relationship with the ruling elite/inner circle on whom his power depends—preventing a coup).
- These two problems are governed by **different actors, different threats, and different logics**, and much of the confusion in earlier authoritarianism literature (which often treated “the regime” as a unitary actor facing only mass threats) stems from collapsing them. Institutions and strategies that solve one problem (e.g., repression against the masses) do little to solve the other (e.g., reassuring allies against future expropriation of power).
- **The problem of power-sharing is modeled as a fundamental commitment/moral hazard problem:** a dictator and his allies jointly hold power only through mutual cooperation, but once in power a dictator has a standing incentive to **renege** on power-sharing arrangements and concentrate (“personalize”) power at the allies’ expense—and allies know this. Because there is no external enforcer (an authoritarian regime lacks an independent judiciary/constitutional court with teeth), power-sharing pacts are **self-enforcing at best**, sustained only by the credible threat that reneging will trigger a coordinated **coup** by the allies.
- This yields Svolik’s core formal result: stable authoritarian power-sharing is possible only when the dictator’s short-run temptation to grab more power is outweighed by the long-run value of continued cooperation with allies—an equilibrium condition that depends on how visible/verifiable the dictator’s power grabs are, how easily allies can coordinate a coup, and how much both sides value the future (discount factors). **Purges and coups are therefore not evidence of institutional failure but the equilibrium enforcement mechanism of power-sharing itself**—coups are what happens off the equilibrium path, or when the underlying balance of power shifts.
- **The paradox of dictatorship:** the very mechanisms a dictator might use to protect himself from a coup (e.g., concentrating control over the military, purging potential rivals, building a personal security apparatus) are themselves the actions most likely to *provoke* a coup, because they signal an intent to renege on power-sharing—allies face a use-it-or-lose-it incentive to strike first. Consolidation of personal power and vulnerability to violent overthrow are thus deeply intertwined, not opposites.
- **Authoritarian institutions (parties, legislatures, elections) are best understood as solutions to both problems at once**, not as window dressing or as evidence of “hidden democratization.” They serve as: (1) power-sharing devices—formal rules that make the ruling coalition’s bargains more transparent, verifiable, and costly to violate, thereby

raising the credibility of the dictator’s commitments to allies; and (2) control/co-optation devices—mechanisms for gathering information about popular and elite discontent, co-opting potential opposition figures with a stake in the system, and channeling distributive concessions to regime supporters without conceding actual power.

- **Repression and co-optation are complementary, not substitute, strategies of authoritarian control:** dictators repress those who cannot be credibly bought off or those whose loyalty is unverifiable, and co-opt those whose cooperation can be secured more cheaply through concessions, patronage, or institutional inclusion (e.g., seats in a legislature); the mix depends on regime type, information about the opposition, and the fiscal/coercive resources available.
- **Data and method:** Svoboda grounds the theory in **large-N cross-national analysis** (his own dataset on authoritarian regimes, leadership tenure, coups, purges, and institutions spanning the postwar period) combined with formal modeling and illustrative case studies (e.g., Iraq under Saddam Hussein, the Soviet Union, Mexico’s PRI, various military juntas)—explicitly building a **general, comparative theory of authoritarian government** intended to travel across regime subtypes, not a taxonomy of regime types for its own sake.
- **Substantive payoff:** because power-sharing problems are pervasive and structurally difficult to solve, **authoritarian regimes are inherently less stable/durable than commonly assumed**, and much of the observed variation in authoritarian durability, personalization, and institutional design is explained by how well a given regime’s institutions manage the dictator–elite commitment problem, rather than by ideology, culture, or leader personality alone.

2 Key Concepts

- **Problem of authoritarian control:** the strategic interaction between the regime and the citizenry/opposition over whether to comply, protest, or rebel, and whether the regime represses or accommodates—analogue to (and building on) classic “dictator’s dilemma” and repression-dissent literatures.
- **Problem of power-sharing:** the strategic interaction *within* the ruling coalition (dictator and inner-circle allies who control critical levers of coercion—military commanders, party barons, security chiefs) over the division of power and spoils, and over whether allies stage a coup.
- **Ruling coalition:** the (typically small) group of elites whose active cooperation is necessary for the dictator to remain in power—distinct from the broader “selectorate”/nominal support base in selectorate-theory language; the locus of the power-sharing problem.
- **Moral hazard in authoritarian power-sharing:** once allies have helped install/maintain a dictator, the dictator has an ex post incentive to renege on the implicit power-sharing

bargain, since allies' outside options/ability to retaliate are typically weaker after the fact than before—a temporal commitment problem structurally similar to hold-up problems in contract theory.

- **Self-enforcing power-sharing / contracting problem:** because authoritarian regimes lack third-party (judicial/constitutional) enforcement of intra-elite bargains, power-sharing arrangements must be enforced by the credible threat of coup, making them “self-enforcing” equilibria of a repeated game rather than binding contracts.
- **Coup as equilibrium discipline device:** coups (and the threat thereof) function analogously to the threat of strikes or trigger strategies in repeated games—their disciplining effect on the dictator's behavior operates whether or not a coup is ever actually launched; observed coups represent instances where deterrence failed or where beliefs about the balance of power shifted.
- **Personalization of power:** the process by which a dictator progressively concentrates control over the security apparatus, appointments, and policy at the expense of nominal allies/institutions—simultaneously a rational response to the power-sharing problem (fewer veto players to coordinate against him) and the proximate trigger most likely to provoke the very coup it is meant to forestall.
- **Authoritarian institutions as commitment devices:** legislatures and ruling parties, by regularizing appointments, patronage distribution, and elite bargaining, make violations of the power-sharing pact more visible/verifiable to the ruling coalition, raising the (reputational and coordination) cost of reneging and thus stabilizing power-sharing—an argument in the same family as (but distinct in mechanism from) Boix, Gandhi & Przeworski, and Magaloni's arguments about authoritarian institutions.
- **Elections under authoritarianism:** functions as (a) an information-gathering device about regime popularity and potential dissent, (b) a co-optation mechanism (distributing patronage/office to regime-loyal candidates and local notables), and (c) a signal of the regime's organizational strength meant to discourage opposition mobilization and elite defection—not (or not primarily) a step toward genuine democratization.
- **Regularized succession:** institutionalized rules for leadership turnover (e.g., single-party regimes' internal norms, term limits within the ruling group) as a further device for reassuring elites that power will eventually be redistributed, mitigating the power-sharing problem over time horizons longer than a single leader's tenure.
- **Distinction from “dictator's dilemma” (Wintrobe):** whereas Wintrobe's classic dictator's dilemma centers on the ruler's uncertainty about mass loyalty absent free information (solved via a mix of repression and loyalty), Svobik's power-sharing problem centers on *elite* commitment/enforcement, a analytically distinct and, he argues, empirically more consequential threat to authoritarian survival (coups outnumber successful popular revolutions historically).

3 Chapter-by-Chapter Overview

Chapter 1: Introduction

- Motivates the book with the empirical prevalence and durability puzzle of authoritarian rule since 1945, and criticizes the existing literature for either (a) treating dictatorships as a monolithic “other” defined negatively against democracy, or (b) proliferating regime typologies (military, single-party, personalist, monarchy) without a unifying causal theory of *why* these institutional forms arise or how they function.
- Lays out the book’s central analytic move—separating the problem of **authoritarian control** from the problem of **power-sharing**—as the organizing framework for the rest of the book, and previews the combination of formal modeling and large-N cross-national data that will be used throughout.

Chapter 2: Authoritarian Politics: A Framework

- Develops the theoretical framework distinguishing the two core problems and their respective principal threats to a dictator’s survival: **popular rebellion/revolution** (control problem) versus **coup d’état by ruling elites** (power-sharing problem).
- Reviews and critiques prior approaches (modernization theory, selectorate theory/Bueno de Mesquita et al., Wintrobe’s dictator’s dilemma, Geddes’s regime-type typology), positioning Svoboda’s framework as a synthesis that can incorporate insights from each while providing sharper microfoundations for the elite-level commitment problem that prior work underspecified.
- Introduces the empirical regularity motivating the book’s emphasis on elites: historically, far more authoritarian leaders lose power via coup or ouster by ruling-coalition insiders than via mass uprising—making the power-sharing problem, not just mass control, central to explaining authoritarian survival and breakdown.

Chapter 3: Protest, Repression, and the Problem of Authoritarian Control

- Formalizes the interaction between citizens (who decide whether to comply, protest, or rebel) and the regime (which decides whether to repress or accommodate), building on and extending repression/dissent and coordination-game (revolution) literatures.
- Explores how uncertainty about regime strength/willingness to repress and about the scale of popular discontent shapes equilibrium outcomes, and how repression can both deter and provoke further unrest depending on context and information.
- Uses cross-national data on protest and repression events to illustrate the empirical patterns predicted by the model.

Chapter 4: Co-optation and the Instruments of Authoritarian Control

- Analyzes co-optation (patronage, legal opposition parties, legislative seats, corporatist inclusion of labor/business groups) as an alternative or complement to repression for managing the mass/opposition threat, emphasizing the informational and cost-saving advantages of co-optation over blanket repression.
- Discusses how nominally democratic institutions (elections, legislatures) under authoritarianism serve control functions—channeling opposition energy into regime-sanctioned arenas, revealing information about popular discontent, and dividing the opposition between insiders (who gain from participation) and outsiders (who are marginalized).

Chapter 5: A Theory of Authoritarian Power-Sharing

- Presents the book’s signature formal model: a repeated game between a dictator and an ally (or allies) over the division of power/spoils, in which the dictator can attempt to seize a larger share (“renege”) and the allies can respond by staging a coup.
- Derives the conditions under which power-sharing is sustainable as a self-enforcing equilibrium—dependent on the observability of the dictator’s actions, the allies’ coup capacity and coordination ability, and the discount factors (patience) of both sides—and shows how shifts in the relative power or information of dictator vs. allies (e.g., military victories, economic windfalls, external support) can destabilize a previously stable equilibrium.
- Explains coups and purges as predictable equilibrium phenomena: purges occur when a dictator judges he can safely eliminate an ally without triggering coordinated retaliation; coups occur when allies judge the dictator is reneging (or about to) and the balance of power favors striking.

Chapter 6: Institutions and the Logic of Authoritarian Power-Sharing

- Extends the power-sharing model to explain **why** certain authoritarian regimes build formal institutions (ruling parties, juntas, legislatures with real intra-elite bargaining functions) while others remain purely personalist.
- Argues these institutions function as commitment technologies: by making the terms of power-sharing (appointments, resource allocation, succession rules) more transparent and routinized, they lower the cost of monitoring the dictator and raise the credibility of power-sharing pacts, thereby extending both regime durability and the dictator’s own tenure (a seeming paradox: constraining the dictator can make him more secure).
- Contrasts stable, institutionalized power-sharing regimes (e.g., single-party and military-junta regimes with strong internal norms) against personalist regimes, which lack such

commitment devices and are shown empirically to be both more prone to sudden violent removal of the leader and, conditional on survival, more prone to further personalization.

Chapter 7: The Political Economy of Authoritarian Rule / Regime Dynamics

- Traces the lifecycle dynamics of authoritarian regimes: how power tends to become more personalized over a dictator's tenure as he learns about and eliminates threats, why this trajectory increases vulnerability to a late-tenure coup even as it appears to consolidate control, and how succession moments (death, term limits, external shocks) are especially destabilizing because they reopen the power-sharing bargain among a new configuration of elites.
- Connects these dynamics to broader empirical patterns in authoritarian leader tenure, exit type (coup, natural death in office, ouster, transition to democracy), and regime survival, using the book's cross-national dataset.

Chapter 8: Conclusion

- Synthesizes the control/power-sharing distinction as a general lens for authoritarian politics, arguing it clarifies puzzles left unresolved by regime-typology approaches (e.g., why nominally similar regimes—two single-party states, two militaries—can differ enormously in durability and violence depending on how well they solve the power-sharing problem).
- Discusses implications for democratization: because authoritarian breakdown is disproportionately elite-driven (coups, negotiated elite transitions) rather than mass-driven, transitions to democracy are often shaped as much by the internal power-sharing logic of the outgoing authoritarian coalition as by popular mobilization—linking the book's framework back to the broader democratization and regime-transition literature.

4 Core Works Cited / Interlocutors

- **Ronald Wintrobe**, *The Political Economy of Dictatorship* (1998)—originator of the “dictator's dilemma” (uncertainty about loyalty under repression); Svobik's power-sharing problem is explicitly positioned as a distinct, elite-focused complement to Wintrobe's mass-focused dilemma.
- **Bruce Bueno de Mesquita, Alastair Smith, Randolph Siverson, and James Morrow**, *The Logic of Political Survival* (2003)—the selectorate theory of winning coalitions and private-goods provision; Svobik engages and refines the “ruling coalition” concept with an explicit repeated-game commitment-problem microfoundation.
- **Barbara Geddes**, work on authoritarian regime typologies (military, single-party, personalist, monarchy) and coalition dynamics within regimes—a key predecessor whose typological approach Svobik builds on but seeks to move beyond via a unified causal theory.

- **Jennifer Gandhi**, *Political Institutions Under Dictatorship* (2008), and **Gandhi & Przeworski** on legislatures/parties as co-optation devices under authoritarianism—closely related arguments about authoritarian institutions that Svulik builds on and partly re-frames around the power-sharing (not just control) function of institutions.
- **Beatriz Magaloni**, *Voting for Autocracy* (2006), on Mexico’s PRI and single-party dominance as a power-sharing/co-optation equilibrium—an important case-study antecedent for Svulik’s institutional argument.
- **Carles Boix**, work on inequality, repression, and regime transitions—part of the broader political-economy-of-authoritarianism literature Svulik situates the book within.
- **Adam Przeworski** (and Przeworski, Alvarez, Cheibub & Limongi, *Democracy and Development*, 2000)—on regime classification and survival, providing methodological/data precedents for Svulik’s own cross-national regime dataset.
- **James Fearon**, on commitment problems and credible signaling in bargaining/conflict settings—the general game-theoretic toolkit (repeated games, self-enforcing agreements, information problems) that underlies Svulik’s formal modeling of both the control and power-sharing problems.
- **Samuel Huntington** and modernization-theory antecedents on political order and institutionalization—part of the older literature Svulik critiques for lacking a rigorous account of intra-elite bargaining within authoritarian regimes.
